

Task 14 – Basic Sales Summary

Data Analytics Track | Level 1 | Day 14

1. Objective

The objective of this task is to build a basic business sales summary using Excel. The analysis calculates total sales, average sales per transaction, and the number of transactions.

2. Dataset

A synthetic retail sales dataset containing 30 transactions was created because no source dataset was provided with the task. Each record includes transaction ID, date, city, product, category, quantity, unit price, and sales amount.

3. KPI Results

KPI	Result	Meaning
Total Sales	■886,818.82	Sum of all sales amounts
Average Sales	■29,560.63	Average sales value per transaction
Transaction Count	30	Number of sales records

4. Excel Formulas Used

KPI	Excel Formula
Total Sales	=SUM(Sales_Data!H2:H31)
Average Sales	=AVERAGE(Sales_Data!H2:H31)
Transaction Count	=COUNT(Sales_Data!H2:H31)

5. Manual Verification

The calculated total sales were manually verified as ■886,818.82. The average sales value was verified as ■29,560.63, and the transaction count was verified as 30. The Summary sheet contains a separate manual-verification section.

6. Business Interpretation

The dataset contains 30 recorded transactions. Total sales represent the overall revenue value of the sample, while average sales of ■29,560.63 show the typical transaction size. These three KPIs provide a simple starting point for monitoring sales performance.

7. Interview Questions

What is a KPI? A Key Performance Indicator is a measurable value used to track performance against a business objective.

How is average different from total? Total is the sum of all transaction values, while average is the total divided by the number of transactions.

8. Deliverables

The accompanying Excel workbook contains the raw sales data, a KPI summary sheet, formulas, manual verification values, a category-wise sales analysis, and a chart.
